

## **MaGrav Discussion about Cu wire Windings & What really is Electricity**

2023 02 22 from 473 KSW

In the 473 KSW many more hints were given about the MaGrav and maybe it's time to discuss it in a deeper and more technical way. Mr. Keshe's style of teaching is to not "spoon feed the child," but let it to find the answers within himself. On a side note he mentioned about a man who was an expert in electric motor windings, and that after he talked to him about some work he wanted done, the man realized he didn't know much about windings in the way needed for plasma. So he went back to school for about 6 months or so just to better understand the windings. This is a big hint for us. And he said about someone in Jalal's group, he is a good Knowledge Seeker (KS) but he is not knowledgeable in electrical science. Thirdly, he mentioned about the transformers, which are again Cu wire windings. And he said, if you wind the coils backwards, then you would produce hundred times more electricity. I am bringing all this up, because after this workshop it is clear to me that the MaGravs work. I think they will work even if they are not done perfectly. But we just don't have the right knowledge to "crack the door open." I am not talking about copying something. I am talking about trying to understand what is electricity in the first place. I will come back to this later.

I am hoping that there is somebody among us who is technically orientated or is willing to teach him or herself to go to the next step. What do we know about Cu itself and when

it is wound up in coils, what properties does it have? Why does Cu show up everywhere when it is anything to do with electricity? Then Cu is there. Even matter state Cu is a plasma of a low strength. I feel certain that the existing matter state knowledge about Cu is enough to bring us forward, but we have to start looking for it. And then transfer it into plasma knowledge.

Our dear friend Mario who passed away started getting into the field flows of the Nano wires and the flower of life. But nobody else picked up on it to go further with him. When I look at the Nano coils I don't understand how the fields flow, so how can I take it to the next level. Back around the 60th KSW Mr. Keshe was prepared to spend days and weeks on studying the basics of the field flows, but after some hours, the KS didn't want to go there, so he left it. We were not ready. At some point the fundamental understanding of how the fields flow has to be learned. Otherwise, we plug in the MaGrav and all we can do is look at the meter, is it reducing or not. We can't do anything with it.

Going back to the windings. What do we know about electricity? Magnets are spun around each other, and the scientists say by breaking the M fields of the magnets you create electricity. Is it really breaking the M fields? Or are fields rubbing up against each other? I tried putting the probes of a voltmeter to 2 magnets and rubbing them against each other, but no voltage occurs. So it is not just rubbing M fields. There is more to it.

If you turn an electric motor backwards you get electricity. Electric motors are Fe magnets wrapped in a specific way with Cu wires, with specific diameters and number of turns and angles of the wire. All this has been studied and well documented, but the knowledge of it is being interpreted in a very narrow way. They see the effects, but they don't understand actually what is happening or why it is occurring. The other problem is that they have fixed ideas, and wrong assumptions about what electricity really is. Therefore the scientists can't really go further on it. But every scientists finds out quickly, that if they truly try to advance the knowledge their life and career becomes at risk.

So what we want to do is to access to their knowledge, but put it in the framework of plasma. When approaching this data we want to keep our fresh innocence and sincerity, and through the humility of "not knowing," open the doors, by feeling the information and understanding the intelligence and the flow of the plasma. If we had the knowledge from years of study and work as an electrical engineer, together with the innocence of the true KS who experiences the fields, then this amalgamation could open the knowledge. If one of us breaks through he can explain to the rest of us, in a way we can understand. Alekz of Nigeria is one of these people and he was also mentioned in this workshop. If only it could be explained in a technical way, it would be the perfect combination.

What I am trying to do with this paper is to brainstorm and put on the table what we already know, that it will give us the direction of where to go. The people with the science background, if they could come and help those of us without any science background, to start thinking, but more pondering about the flow of the plasma. Like when you take a walk and are relaxed and you suddenly see the branches of a tree, and

start wondering how the fields are flowing. This will open up the knowledge. Getting the answers does not help much, because then you get addicted to being "lazy brained." It's about feeling it inside your being, and then being able to explain it to the others.

One of our problems is that, we think of plasma as flowing from positive to negative like electricity. But actually we were taught it flows from a stronger plasma to a weaker plasma. This is the fundamental understanding. But how does it communicate with the weaker. On the grid, the communication comes through the electric transmission lines. Our thoughts get stuck on these wires. But only the "hot" wire or positive is connected to the MaGrav, then the "hot" comes out of the MaGrav and to the electric appliance, then it can reach the "neutral" or negative wire and go back to the power station on the grid. How is the MaGrav sending all that power back to the grid, and that we are not able to detect it? The power company only understands that they are receiving more power, but they don't understand the why and how.

You can put an Amp meter on the "neutral" wire coming out of the electric box in your house. From there it goes to the meter and then to the transformer, and then to the substation. But you'll be very surprised to find out, that for every kilowatt that you pay for, 0.5 kilowatts goes back to the transformer to be recycle and sold to you again. The power companies found this out a long time ago, but kept it secret. That's when they stopped connecting your electric box to a true ground. They have been making millions out of it. There is so much we are not being told about "electricity." Why does half the current go back? Are these really M fields? But let's not get side-tracked on this part.

We know that some times the transformers are getting blown up from too much power coming from the MaGravs, and that the substations are receiving 3 times more electricity. I would like to know how it is getting there. It would help us understand plasma more. Is it only traveling down the "neutral" wires or could it be jumping over the positive flow to the transformer? Like a river, where the center of the river flows down, but the sides flow back upwards. We don't know, it has not been investigated. This is where these kind of assumptions block our understanding. Again in this workshop he mentioned Einstein's  $E=MC^2$ , that it is all assumption and nonsense, and society makes him out to be a mystic. These are the blockages to our understanding. I think it was Tesla, Maxwell and Heavyside who together discovered that the electric current flows outside the wire and not inside like scientists believe. This also means that the plasma has intelligence, because it knows to go to the substation no matter what. It has to get there to give to the weaker. But how does the plasma know that the substation is weaker? This has not been answered.

It's hard when we don't have the technical background, because then we have gaps in our knowledge. But at the same time it can drive us forward to understand. This is where we need to have love for the plasma, maybe that is enough. There is a beautiful story in India of a man who learned archery through his devotion. The guru would not teach him, so the student made an image of the teacher, and worshipped it. Through his devotion and hard work he mastered archery. He learned through the Soul. We can do the same right here.

But we have to get some love for wanting to understand. It's not to get free electricity, but to become independent and free, and then to share the knowledge with the others.

So how does electricity work? We know we have 3 components. First is the generation of the power or source, then the transmission of the power, which requires communication between the source and the target. Third is we have to be able to receive it and convert it into usable energy. For right now forget about a totally stand alone generator. Mr. Keshe is "cooking that pot" for later. Right now we have a hybrid that uses electricity and plasma. We get the electricity coming off the grid to stimulate the plasma in the MaGrav, then the MaGrav converts the energy from our environment into usable electricity at 70% reduction. Let's try to get this thing working first.

The best I have been able to do with my MaGrav is to take 20 watts from the grid and run it through the MaGrav coils and light a 20 watt bulb. No savings and 1:1 power consumption. But if I put an ohm meter on the Nano coils, electricity cannot pass through it. Impossible. So maybe it is going from electricity to plasma and back to electricity to light the bulb. I put one MaGrav on top of the other in an "Infinity Loop" connection with about 10 inches between them. I put them on top of each other because Mr. Keshe said most of the fields come out the top of the coils. So in between the 2 MaGravs I have created a "center core" of fields, which I tested with one of those electricity checkers, the kind that beeps. Definitely, the stronger fields are being formed in that "Center" between the 2 MaGravs. But I don't believe it has reached the point of being a soul. I don't know.

The electricity is only connected to the top MaGrav and not to the bottom. But the Infinity Loop is made with Cu wires. I wanted to check if I could run another appliance off the bottom MaGrav connect the neutral to the neutral of the grid, and just touching the Nano materials. Sparks come off the Nano material and light the appliance.

Another thing I noticed is that I don't even need to run the 20 watt light, because the amp meter draws 120 volts and only 0.02 Amps. It's enough to excite the plasma. I checked the voltage with a meter and it reads 120 volts coming out of the MaGrav. The strange thing is sometimes the voltage fluctuates. I can even take a voltage reading with a single probe, and I still get about 8 to 10 volts AC. But I can also do that by putting a single probe in a 120 volt AC socket. Again this doesn't make sense with modern physics. You need to have a positive and negative, not a single probe.

One time I hooked up a 12 volt DC LED to the Nano coating, thinking it would know the difference between AC and DC. It didn't. It burnt out the LED. So it appears, that the plasma is trained by what you feed into it. I tried hooking up a DC battery to the MaGrav, I could not get it to flow. There must be a special way to work with DC.

Let me conclude by saying that this is the extent of my knowledge. I love to look at the MaGrav especially when current is flowing through it. But I cannot seem to understand how the fields are flowing. And the biggest problem is that we can't see it. I have not been able to connect through the Soul, but I try. I feel that there must be a way in matter state to also access it, and that is what we are trying to learn together. If you would like to

share your ideas and comments, it would be greatly appreciated. There must be a lot of things we could do with these MaGravs, if only we could get the right kind of interest in it. It seems to me the way to bring the change is to also use the technology, so that it starts generating fields, and they gradually build up.

Thank you for listening.
