## **Excerpt from the Quick Index of the 578 KSW**

Note: Quick Index has not been checked by KF. (Interpretation by KF Brazil)

**Q: What happens when we use caustic to Nano coat, because the heat of caustic is not enough to melt the copper nor enough to create chemical reaction. What it does is enough to pass the Coulomb barrier and allow the atom to be released. It's just like the atom gets fat.**

K- (No, now wait. What is caustic? NaOH? (The energy is delivered by Hydrogen (H), like what they do with hydrogen laser beams to melt something. We use the energy of the H to inject energy into the atomic structure, or plasma structure to change it. It separates and breaks the Coulomb's barrier. (Is this by coincidence?) And part of that conversion is not (from the) heat, it's a direct injection of the plasmatic energy. It took me years to develop and understand how to use the NaOH. It took years).

Q: When that energy is released and given to the atom, I say it gets fat.

K- That's the wrong word. It doesn't get fat, it gets liberated.

Q: If I Nano coat Cu, can I make it go back to Cu again?

K- Yes if you know what to do. We do it. (But we don't teach it, it is not a process to be taught).

Q: (It's interesting because the body also replicates this when you say two CO<sub>2</sub> keep their distance from each other through MaGrav positioning. So if you introduce a Hydrogen in between, because of the friction between them, they create light. And if you create enough resistance in front of it, they create heat. Can we create a spaceship in our body, we can create the heat or coolness?

K- Yes.

Q: Playing with the same thing?

K- We don't play, our body does it.

Q: No, I mean, I can create light in my body following the same concept.

K- (You can create anything if you understand. But the KS have never understood. One day they might understand the property of the Inertia of emotion. The power of the Inertia of emotion. You can create heat within your body and submerge in ice water for hours that would normally kill someone).
